

A Low Code Document Extraction Platform

A Low Code
Document Extraction Platform

Pre-built AI for extracting
Financial Statement, IDs,
Application Docs, Report,
Invoices, Receipts

Help our clients

Save manual effort,
cross check input error,
streamline the workflow

3 >80%

With ROI

We turn unorganised data from OCR engines to structured data in JSON

(Data got from an OCR engine)

(Structured data returned by FormX)

Why clients Adopt FormX.ai

Client's Goal

Enhance UX

Users no longer need to type input for applications or submission. All they need is take a photo on relevant documents, then FormX will extract the information and fill the form for the users.

Release Manpower

No need to work on the programming and no need to work on manual input. The IT team can focus on more important application and the user can self-serve using Al for the tedious work.

Speed Up Process

FormX shortens the time and minimize manual input error, Client can speed up lots of work process, application process to provide a better service for internal terms or customers.

Use Cases by FormX

Resumes

Certificates

Receipts

Invoices

Bank Statements

Passports and IDs

Table Forms

Contracts/Agreements

And with GPT

FormX & GPT-4 Integration

Increase Accuracy

This integration results in a more comprehensive understanding of data, which enables organizations to process data extracted more accurately and efficiently

Automate more complicated use case

This integration has accelerated digital transformation for all types of documents from simple format to complex format documents

Train with fewer Samples

Creating your own extractor has become much more efficient with minimum training samples

How FormX works?

Upload a photo

Your users scan and upload a form via your app.

2

Pre-process

Optimise the scanned photo for light condition, skew correction, edge detection, etc.

5

Return a JSON

A key-value pair JSON that contains the relevant fields will be returned to your app.

3

Pass it to OCR

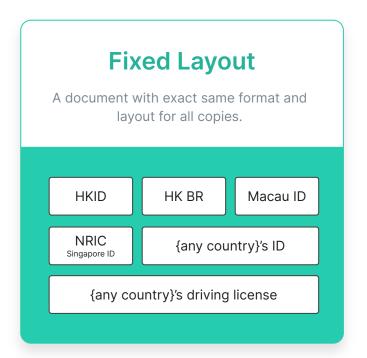

Pass it to Google or Azure Vision or other 3rd party OCR engines to recognise the characters of each field.

4

Extract information

We extract data by semantic, layout and other info with ML models, and also auto-correct the data

Use Our Pre-Built Extractors

Build Your Own Extractor

Fixed Layout

Configure with 1 neat Document Copy on our Web portal. You can set up the fields you would like to extract easily.

Upload 1 Copy to Setup

Variable Layout

Prepare 50 - 100+ copies (depending of the diversity of the documents) for training your own AI Extractor without a developer or AI engineer.

Enhance the Accuracy of Pre-built Extractor for your Use Case

Train a completely **new** Extractor

Pre-processing Features

1

Adjust the angle and quality of an image

FormX pre-process uploaded photos to improve the OCR accuracy. Photos are optimised for lighting condition, contrast, skew correction, edge detection, etc. 2

Classifier for Multiple Documents

Our Extractor Group helps you classify the document. All uploaded documents will be automatically assigned to the best-matched document extractor.

3

Split a page of multiple documents

If users put everything (such as passport & driving license) together in a page of document, FormX helps you split it into multiple images for further extraction.

Other Features

4

Logos / Portrait Extraction

Besides texts, FormX is able to recognise any images such as logo, portrait, signature, etc.

5

Desktop & Webhook Support

Besides JSON API, you can also use our desktop apps or webhook feature to integrate with G Sheet / Airtable to batch process the documents. 6

Multiple OCR engines support

FormX currently supports Google Vision API, Azure Computer Vision OCR and Tesseract. It also means we support a lot of different languages.
